

Object-Oriented Programming: Project

Alevtina Andrianova, 00332553

Evelina Jermakova, 03440612

Space Colony - Android Game

For this project we plan on making a space colony game. It will feature player fighting against different threats, acquiring and training colony personnel. This project was done by a group of two: Alevtina Andrianova and Evelina Jermakova.

The project was developed using Android Studio and tested both in Android Studio emulator and on Android based mobile device. Tools used were Android Studio for coding, GitHub for sharing the project, and screen recorder with OneDrive for video recording and upload.

The project is also shared via GitHub. For installation, Android Studio emulator works well, but if the app is taking long to start or Android Studio is not properly working, downloading apk file to Android phone and running up there.

The project plan was shared 50/50, there tasks were shared evenly, UML was mainly done by Alevtina, and text mainly written by Evelina. For the main part of the project, Alevtina did the basis of the code and documentation, while Evelina was refining the code further by adding more features and video explanation. For the bonus features, we managed to add statistics and randomness in missions. The GitHub and Video links are found in the "Project work final submission" area.

AI Declaration: The project was human made, but AI was used to assist to fix minor bugs. The AI used was Microsoft Copilot and ChatGPT.

UML diagrams describing the implementation
